PEEL-OFF TECHNOLOGY

Peel-off masks are skin care products that have been included in professional skin care routines for many years. These powder products are made of alginate and require a mixing step with water before being applied to the skin. A natural alginate complexation reaction consequently occurs, turning powder into a soft mask. Peel-off masks perfectly shape facial or body contours, helping active ingredients to penetrate the skin. Once dry, this second skin can be removed in one piece and does not need to be washed off.

BIESTERFELD PRODUCTS

GENENCARE® OSMS MI

Natural inositol derived from sugar beet root. Osmolyte that helps to maintain the skin moisture due to its excellent water-binding capacity. As a component of the NMF it protects cells from environmental stress. Used in a variety of skin care and personal care applications including vegan concepts. Especially interesting for anti-age formulations as it improves skin elasticity and cell metabolism of dermal fibroblasts. Palm-free, Ecocert, COSMOS and Natrue certified.

SACHET MV BLUE

Eye-catching manganese violet synthetic fluorphlogopite pearl which delivers dazzling blue duo interference effects. The intense color flipping characteristic of this pigment is truly unique and the 10-60 µm particle size provides brilliant coverage.

ORGANIC CORN STARCH POWDER

Starch is constitutive of various vegetable such as corn, rice, barley and wheat being the main source of energy for their growth. We have selected a corn starch with a European origin from organic farming. This product quality ensures the absence of GMOs and ionization. It has hygroscopic properties that can retain water at the skin surface as well as mattifying benefits, reducing the greasy appearance of oily skins.

SNOW ALGAE

Snow algae grow in extreme temperature and UV conditions, under snow and ice. When conditions become even harder in winter, snow algae produce a high quantity of UV protective red pigments named carotenoids. They then enter a dormant phase until springtime. During this phase, snow algae are therefore far more concentrated in carotenoids than in chlorophyll. Their color shifts from green to red, giving to ice and snow a reddish color that can sometimes be seen in glaciers and Alpine permanent snow. Besides being pigments, carotenoids are also powerful antioxidants fighting against oxidative stress and therefore skin aging.
